Care CEUs

The Future of Care: Leveraging A.I. in Senior Living

1. Which core AI concept is designed to perform a specific set of tasks, and is exemplified by tools like email spam filters or virtual assistants like Siri?

A. Artificial General Intelligence (AGI)
B. Deep Learning
C. Narrow AI
D. Machine Learning

---

2. In the scenario where AI predicted Mrs. Johnson's respiratory distress by analyzing patterns, what AI capability was primarily responsible for this proactive intervention?

A. Generative AI
B. Natural Language Processing (NLP)
C. Robotics
D. Deep Learning

---

3. Which is a key ethical consideration when implementing AI in long-term care, especially regarding maintaining a human-centered approach?

A. Algorithmic Bias
B. Cost Reduction
C. Enhanced Workflow Efficiency
D. Personalized Care Plans

---

4. What benefit does AI-driven predictive analytics offer in the context of dietary operations within senior care facilities?

A. Elimination of Manual Cooking Processes
B. Foreseeing Nutritional Risks and Adjusting Meal Plans Proactively
C. Creating Unique Personal Care Plans
D. Establishing Privacy Protocols

---

5. In the context of integrating AI into senior care, what is an expected outcome of automating routine documentation tasks?

A. Increased Nurse Burnout
B. Enhanced Privacy Concerns
C. Reduced Patient Interaction
D. Increased Direct Care with Residents

---

6. What is a fundamental advantage of integrating AI in dietary departments in long-term care facilities?

A. AI completely replaces human judgment in meal planning for operational improvement.
B. AI serves as a supportive tool that enhances human expertise in managing meal planning.
C. AI is used to monitor every aspect of dietary operations comprehensively and independently.
D. AI eliminates the need for staff interaction with residents by automating nutritional tracking.

---

7. How does AI contribute to optimizing staff schedules in long-term care settings?

A. AI calculates staff schedules solely based on staff availability.
B. AI schedules are created to replace supervisory roles in staff coordination entirely.
C. AI identifies required certifications and adjusts schedules based on predictions of resident needs.
D. AI uses historical data to adjust schedules mainly for administrative convenience.

---

8. In what way does AI enhance safety in long-term care facilities?

A. AI is used to identify falls and unusual patterns, alerting staff in real time.
B. AI autonomously initiates emergency protocols without human oversight.
C. AI independently handles crisis intervention without requiring staff confirmation.
D. AI replaces human decision-making in all safety procedures.

---

9. Which of the following ethical considerations is crucial when implementing AI in long-term care?

A. Ensuring that AI algorithms do not require validation checks.
B. Guaranteeing transparency and accountability for AI decisions.
C. Relying solely on an inclusive dataset for training AI systems.
D. Prioritizing technological advancements over resident privacy rights.

---

10. How are AI-powered predictive analytics used in Performance Improvement Plans (PIPs) within QAPI programs?

A. They enable retrospective analysis of successful project outcomes.
B. They are used to predict long-term staff training needs exclusively.
C. They facilitate proactive risk management by anticipating potential areas of clinical improvement.
D. They establish universal standards without considering facility-specific data.

---

11. Which of the following best describes the role of AI in streamlining Performance Improvement Projects (PIPs) in long-term care settings?

A. AI can independently identify and solve all issues within a facility.

B. AI can quickly analyze datasets to identify high-risk areas that warrant a PIP.
C. AI can completely eliminate the need for human insight in decision-making processes.
D. AI can only provide feedback after interventions have been completed.

---

12. What is one of the primary benefits of AI in optimizing resident safety and quality of life?

A. AI can detect changes in resident behavior without the need for monitoring equipment.
B. AI can automatically administer medication without human intervention.
C. AI eliminates the need for personalized care planning by providing generic solutions.
D. AI-powered systems can predict and prevent falls by detecting changes in gait or activity patterns.

---

13. How does AI assist in the comprehensive care plan development process?

A. AI completes all necessary assessments without human input to ensure timely care planning.
B. AI solely drafts care plans, leaving assessment to be conducted manually by staff.
C. AI suggests measurable goals and evidence-based interventions based on resident's assessed needs.
D. AI replaces the need for interdisciplinary team involvement in care planning.

---

14. In addressing ethical considerations with AI adoption in long-term care, which challenge is primarily mitigated through AI?

A. Ensuring the AI fully replaces the human-technology balance in care settings.
B. Implementing safety measures for HIPAA compliance and privacy concerns.
C. Relying solely on AI to address all resident conflicts and needs.
D. Using AI to obscure algorithmic bias in care assessments.

---

15. What process, involving AI, allows staff to prepare confidently for surprise health inspections?

A. Relying solely on past survey results without additional preparation.
B. Using AI to verify only the most obvious regulatory requirements in short notice.
C. Interacting with AI to rehearse policies and procedures, ensuring every detail is covered.
D. Neglecting technology and focusing entirely on conventional preparation methods.

---

16. Which of the following best describes the role of AI in enhancing care coordination and efficiency in long-term care facilities?

A. AI assists staff by organizing tasks and improving information flow.
B. AI performs all administrative tasks autonomously.
C. AI replaces the need for any human supervision or intervention.
D. AI functions solely as a monitoring tool without direct impact on care coordination.

---

17. What potential ethical challenge is associated with using AI for predictive analytics in healthcare?

A. Complete elimination of human error.
B. Over-reliance on AI leading to deskilling of staff.
C. Replacement of all human decision-making processes.
D. Integral involvement leading to constant supervision by staff.

---

18. In the context of AI solutions for long-term care, which of the following impacts was NOT highlighted in the Japanese case study?

A. Reduction in staff turnover rates.
B. Enhancements in care quality and efficiency.
C. Improvement in resident safety through monitoring systems.
D. Decrease in resident capacity due to AI implementation.

---

19. How does the 'Clinical Insight Engine' (CIE) contribute to improved clinical care at Harmony Haven?

A. It automates all resident interactions without need for clinical staff.
B. It provides predictive analytics and assists with early detection of health issues.
C. It prioritizes clinical tasks to automatically replace routine care procedures.
D. It monitors staff efficiency and bypasses EHR integration.

---

20. Which statement best reflects the balance AI aims to achieve in long-term care settings?

A. AI enhances staff capabilities by managing routine tasks, fostering personalized care.
B. AI should replace human staff to optimize operational efficiency.
C. AI focuses on data analysis but lacks practical application in care settings.
D. AI solely manages patient interactions to eliminate staff responsibilities.
